

The Velch Automator: Google Antigravity Build Guide (v2.0)

Author: Taj Sarin, AI Ninja **From:** Sarin-Intelligence **Classification:** For Internal Use Only
Updated: May 26, 2026 — Revised to incorporate all 5 custom proprietary skills

What Changed in v2.0

The original build guide listed generic skills from skills.sh and provided basic Antigravity prompts. This version is materially upgraded in three ways:

1. **Section 3 (Skills Installation)** now includes all 5 custom-built proprietary skills — `velch-gbp-ranking`, `velch-competitor-radar`, `velch-review-blitz`, `velch-instant-quote`, and `velch-dispatch-engine` — which encode Eric Velch's exact strategies directly into the agent's context. The original guide had no custom skills.
 2. **Section 4 (Prompt Sequence)** has been updated. Each prompt now explicitly references the relevant custom skill by name, instructing Antigravity to follow the skill's rules rather than making architectural decisions on its own. This eliminates ambiguity and prevents the agent from inventing its own pricing logic, dispatch rules, or review copy.
 3. **Section 5 (UI/UX)** has been updated to reflect the Mission Control split-panel layout, the Review Gap tracker, and the regional segmentation display — all defined in the custom skills.
-

1. Executive Summary

This document provides the exact Google Antigravity build plan to create a one-click web application that automates Eric Velch's GTA house cleaning playbook. The application, named **Velch Automator**, features a dashboard to sync Google Business Profiles (GBPs), analyze local competitors via the Google Places API, auto-generate SEO copy using GPT-

4o, manage automated review blitzes, and route incoming calls to a human operator with an instant quoting interface. All business logic is encoded in proprietary custom skills that the Antigravity agent loads automatically.

2. Application Architecture (The Velch Automator)

The application is built using the agent-first paradigm in Google Antigravity, utilizing Next.js 14 App Router (frontend), Node.js API Routes (backend), and Supabase (database).

Core Modules

Module	Custom Skill	Purpose
Mission Control Dashboard	velch-instant-quote	Human operator call interface, pricing calculator, booking form
GBP Sync & SEO Engine	velch-gbp-ranking	Google My Business API sync + GPT-4o weekly SEO post generator
Competitor Radar	velch-competitor-radar	Google Places API review threshold check — GO/NO-GO per suburb
Review Blitz Manager	velch-review-blitz	Post-job SMS review requests with keyword coaching + gap tracker
Dispatch Engine	velch-dispatch-engine	Automated SMS broadcast to cleaners with GTA regional segmentation

3. Required Skills Installation

Install all skills before starting any Antigravity session. The agent will automatically load the relevant skill for each module.

Step 1 — Install from skills.sh (Community Skills)

Run from your project root:

```
# Database & Backend
npx skills add supabase/agent-skills/supabase-postgres-best-practices
npx skills add supabase/agent-skills/supabase

# Frontend Framework
npx skills add vercel-labs/agent-skills/vercel-react-best-practices
npx skills add vercel-labs/next-skills/next-best-practices

# AI & Automation
npx skills add vercel/ai/ai-sdk
npx skills add obra/superpowers/subagent-driven-development

# Twilio (Official Publisher)
npx skills add twilio/ai
npx skills add sickn33/antigravity-awesome-skills

# Marketing & SEO
npx skills add coreyhaines31/marketingskills/seo-audit
npx skills add coreyhaines31/marketingskills/copywriting
```

Step 2 — Install Custom Proprietary Skills (Velch Strategy Skills)

These skills do not exist on skills.sh. Copy them from your local skills library into the project's `.skills/` folder:

```
cp -r ~/.skills/velch-gbp-ranking .skills/
cp -r ~/.skills/velch-competitor-radar .skills/
cp -r ~/.skills/velch-review-blitz .skills/
cp -r ~/.skills/velch-instant-quote .skills/
cp -r ~/.skills/velch-dispatch-engine .skills/
```

Why this matters: Without these custom skills, Antigravity will invent its own pricing logic, dispatch rules, and review copy — none of which will match Velch's proven system. The custom skills lock in the exact mechanisms that are documented to work.

4. The Antigravity Prompt Sequence

Execute these prompts sequentially. Always review and approve the agent's Artifact (plan) before allowing it to write code. Each prompt now explicitly references the relevant custom skill.

Phase 1: Project Scaffolding & Database Schema

Prompt 1: Setup & Database

"Scaffold a new Next.js 14 App Router project with a Node.js backend and Supabase integration. Design and implement the database schema for the 'Velch Automator'. Tables required: `GBP_Listings` (our Google profiles, including city, review_count, google_review_link), `Competitors` (top 3 Maps results per city, review counts), `Jobs` (bookings with status enum: pending/assigned/completed), `Contractors` (cleaner network with gta_region field using values: west/north/east/central), and `Customers`. Apply Supabase RLS best practices from the supabase-postgres-best-practices skill. Create an implementation plan Artifact before writing SQL migrations."

Phase 2: Competitor Radar & GBP Sync

Prompt 2: The Threshold Tool (Competitor Radar)

"Build the 'Competitor Radar' module following the `velch-competitor-radar` skill. Create a backend service that takes a GTA suburb and service keyword (e.g., 'Oakville house cleaning') and calls the Google Places API Text Search to fetch the top 3 ranking businesses. Apply the Velch Threshold: flag as GO (green) if at least 2 of the top 3 have fewer than 100 reviews, NO-GO (red) if not. Build a React component with a traffic light visual. Generate an Artifact of the API integration plan before coding."

Prompt 3: GBP Sync & AI Copywriter

"Build the GBP Sync & SEO Engine following the `velch-gbp-ranking` skill. Integrate the Google My Business API to sync active GBP listings into the `GBP_Listings` table. Build an AI Copywriter using the Vercel AI SDK and GPT-4o. The weekly post generation function MUST use this exact prompt constraint from the skill: 'Write a Google Business Profile update for a house cleaning company in [City]. Naturally

include the phrase [City] house cleaning 2-3 times. Keep it under 750 characters.' Add a 'Sync GBPs' button and a 'Generate & Post Weekly SEO Update' button that fires for all active listings simultaneously."

Phase 3: The Review Blitz Manager

Prompt 4: Review Automation

"Build the Review Blitz Manager following the `velch-review-blitz` skill. Integrate Twilio SMS. Create a Supabase database webhook that fires when `jobs.status` changes to 'completed'. The webhook must wait 30 minutes then send the exact SMS template from the skill — including the keyword coaching instruction asking the customer to mention '[City] house cleaning' in their review. Build the Review Gap tracker UI component showing our review count vs. the top competitor's count per GBP listing."

Phase 4: Mission Control & Dispatch (Human-in-the-Loop)

Prompt 5: Mission Control Interface

"Build the Mission Control screen following the `velch-instant-quote` skill. Integrate Twilio Voice to route inbound calls to a web softphone in the dashboard. Implement the exact split-panel layout from the skill: left panel is the softphone + scrollable call script, right panel is the Instant Quote Calculator. The calculator must implement the exact pricing matrix from the skill: 1 Bed/1 Bath = 140retail/85 wholesale, 2 Bed/1 Bath = 190retail/115 wholesale, 3 Bed/2 Bath = 250retail/155 wholesale, 4 Bed/2 Bath = 310retail/195 wholesale, Deep Clean add-on = +70retail/+35 wholesale. Display both retail and wholesale prices side by side. Include the 'Book Job' form with a GTA region selector."

Prompt 6: Automated Dispatch Engine

"Build the Dispatch Engine following the `velch-dispatch-engine` skill. When the operator clicks 'Confirm Booking', trigger a backend Dispatch Agent that broadcasts the exact SMS template from the skill to all active cleaners in the matching GTA region from the `Contractors` table. Implement the full state machine from the skill: `BOOKING_CONFIRMED` → `DISPATCH_BROADCAST` → `AWAITING_RESPONSE` → `ASSIGNED` → `CONFIRMED`, with a 15-minute timeout and 2 rebroadcast attempts before alerting the operator. Send confirmation SMS to both the assigned cleaner and

the customer using the templates defined in the skill. Create an Artifact mapping this state machine before implementation.”

5. UI/UX Design (Screen-by-Screen)

Screen	Key Components	Skill Reference
Dashboard Home	Total Jobs, Revenue, Active GBPs, Pending Dispatches, Review Gap summary	All skills
Market Intel	City + keyword search bar, GO/NO-GO traffic light, review count breakdown for top 3	velch-competitor-radar
GBP Manager	List of synced profiles, review count per listing, “Generate & Post Weekly SEO Update” button	velch-gbp-ranking
Mission Control	Split panel: softphone + call script (left), quote calculator + booking form (right)	velch-instant-quote
Dispatch & Reviews	Live SMS dispatch feed, cleaner assignment status, review request tracker, Review Gap per city	velch-dispatch-engine , velch-review-blitz

6. Technology Feasibility Summary

Technology	Feasibility	Notes
Google Places API	A (90)	Mature API, direct support for review count extraction
Google My Business API	B+ (80)	Requires OAuth approval — apply early, can take 1–2 weeks
Twilio Voice/SMS	A (95)	Industry standard, official skills.sh publisher with 50+ skills
OpenAI GPT-4o	A (95)	Vercel AI SDK abstracts all complexity
Supabase Webhooks	A (90)	Native support for database event triggers
Overall	A (⁹⁰ / ₁₀₀)	All components have mature APIs and official documentation

7. Custom Skills Reference Summary

Skill Name	Encodes	Critical Rule
velch-gbp-ranking	GBP naming strategy + SEO copy constraints	Exact-match business name is non-negotiable
velch-competitor-radar	Velch Threshold logic	GO = 2+ of top 3 have <100 reviews
velch-review-blitz	Review SMS template + 30-min delay + keyword coaching	Never send immediately after job completion
velch-instant-quote	Full pricing matrix + call script + split-panel UI	Always show retail AND wholesale side by side
velch-dispatch-engine	State machine + GTA regions + timeout fallback	Never dispatch cross-region
